Предисловие

Одною из задач Сектора Полярных и Высокогорных Наблюдений Главной Геофизической Обсерватории является обработка и опубликование метеорологических материалов полярных станций.

Настоящее издание заключает в себе материалы метеорологических наблюдений, произведенных на полярной станции Земли Франца Иосифа в бухте Тихой за зимовку 1930—31.

В виду того, что наблюдения полярных станций могут быть получены для обработки лишь после смены персонала станции, которая обычно производится в августе месяце, Обсерватория, чтобы не задерживать издание ниже печатаемого материала, сочла возможным отступить от сроков, принятых в Летописях и опубликовать данный материал не с января по декабрь, а за период зимовки, т. е. за время с 1 августа 1930 г. по 31 июля 1931 г.

Учитывая тот большой интерес, который в настоящее время возбуждают к себе полярные области, Г. Г. О. при опубликовании материалов не ограничилась приведением лишь кратких ежемесячных и годовых выводов, но печатает полностью все имеющиеся в ее распоряжении метеорологические материалы, полагая, что в таком виде они могут быть шире и глубже использованы при решении задач по освоению Севера.

Директор Обсерватории *B. S. Львов*.

Preface

The working out, preparation for print and publication of meteorological data, supplied by the polar stations, form one of the main problems in the activities of the Section for Polar and High Altitude Observations, attached to the Central Geophysical Observatory.

The present publication comprises the material obtained by meteorological observations, carried on during the winter season of 1930—31 by the polar station at Franz Josef Land (Calm Bay).

Considering that the data of observations effected at the polar stations could only be obtained after the wintering staff had been substituted, and the relay taking usually place in August, the Central Geophysical Observatory,—desirous to avoid the delay of this publication—found it more convenient to change the order adapted in the Annales, and to publish the collected material not from January to December, but for the period of the wintering i. e. from August 1930 to July 31, 1931.

Taking into consideration the wide interest aroused nowadays with respect to the Polar regions, it was thought necessary to give not only the concise monthly and annual results, but to publish in extenso all the meteorological data available, assuming that in this form they could be better taken advantage of in solving the problems of the exploration of the North.

B. S. Lwoff, Director

Замечания к наблюдениям

Ниже печатаемые метеорологические наблюдения являются результатом работ за время второй зимовки метеорологической станции на Земле Франца Иосифа, организованной в 1929 г. Всесоюзным Арктическим Институтом.

Результаты первой зимовки этой станции будут опубликованы Всесоюзным Арктическим Институтом.

Местоположения станции. Метеорологическая станция на Земле Франца Иосифа расположена на острове Гукера в бухте Тихой. Координаты станции $\phi = 80^{\circ} 20'$ и $\lambda = 52^{\circ} 48' E$. Остров Гукера, почти сплошь покрытый ледяным покровом, является одним из больших островов архипелага Земли Франца Иосифа. Метплощадка расположена на мысе Седова, обычно свободном от снегового покрова в летнее время. В виду того, что к северу от метплощадки возвышается почти отвесный каменистый склон берега, высота которого 140 м., станция закрыта для ветров N и NE направлений. К югу от станции расположена бухта Тихая и Британский пролив.

Установка приборов, служащих для определения давления. Для определения давления служили: 1) чашечный барометр № 206308/2292, установленный в специальном шкафике, укрепленном на внутренней капитальной стене здания, 2) станционный анероид № 201821/29307, помещавшийся на нижней полке барометрического шкафика и 3) два барографа суточный № 204182/21891 и недельный № 27529 установленные на специальных полочках на той же стене, где помещался барометр. Все приборы были расположены в кают-компании, часть которой была отведена специально для метеорологических работ.

При обработке наблюдений к чашечному барометру № 206308/2292 была принята следующая поправка:

от 790.0 до 761.0	попр. = + 1.8
» 760.9 » 757.0	= + 1.9
» 756.9 » 735.0	= + 1.8
» 734.9 » 716.5	= + 1.9
» 716.4 » 700.0	= + 1.8

Поправка эта определена в мае 1929 года в ГГО при отправке барометра на станцию. Исправное состояние барометра подтверждается определением его поправки, сделанной В. Ю. Визе в 1930 г. По этим определениям поправки расходились всего лишь на 0.04 мм.

Высота барометра над уровнем моря принята равной 5.9 м. Точных нивелировки на станции не производилось.

Ежечасные данные по давлению, приведенные в таблицах с 1 августа по 25 декабря, сняты с суточного ба-

Notes regarding the Observation

The data of observations given below are the results of the work, effected during the second wintering at the Meteorological Station at Franz Josef Land, established by the Arctic Institute of the USSR.

The results of the first wintering of this station will be published by the Arctic Institute.

Site of the Station. The meteorological station at Franz Josef Land is located on Hooker Island in Calm Bay ($\phi = 80^{\circ} 20'$ and $\lambda = 52^{\circ} 48' E$). The Hooker Island being almost entirely covered with an ice cap, is one of the comparatively large islands of the archipelago of Franz Josef Land. The plot for the exposure of instruments is situated on cape Sedoff, usually free from snow cover throughout the summer season; the station is protected from the N and NE winds by almost vertical slopes of coastal rocks 140 met high. The Calm Bay and the British Channel lie south of the station.

Exposure of the instrument Used for the Determination of Pressure. Following instruments were used for the determination of pressure. 1) A cistern barometer № 206308/2292 housed in a special casing, fixed on the inside surface one of the main wall of the building. 2) A station aneroid № 201821/29307 placed on the lower shelf of the barometer casing and 3) Two barographs — a diurnal barograph № 204182/21891 and a week barograph № 27529 installed on special shelves fixed to the same wall with the barometer. All the instruments were exposed in the ward-room, a part of which was specially equipped for meteorological work.

In working out the data, the following correction was inserted into the readings of the cistern barometer:

from 790.0 to 761.0	correction = + 1.8
» 760.9 " 757.0	= + 1.9
» 756.9 " 735.0	= + 1.8
» 734.9 " 716.5	= + 1.9
» 716.4 " 700.0	= + 1.8

This correction was determined at the Central Geophysical Observatory in May 1929, before the barometer was forwarded to the station. The good working order of this instrument was confirmed by the determination of its correction, made by Prof. V. J. Wiese in 1930. According to this determination the corrections did not coincide but for 0.4 mm.

The altitude of the barometer over sea level was adapted as being equal to 5.9 m. No accurate levelling was effected at the station.

Data of hourly observations given in the tables for the period August 1 — December 25 were taken from the

рографа. С 25 декабря 1930 г. по 31 июля 1931 г. данные сняты с недельного барографа, ввиду того, что за этот период суточный барограф не работал из-за поломки часовогого механизма.

Наружные установки. На площадке были установлены две психрометрических жалюзийных будки, обычного типа. Высота будок от поверхности земли 2.3 м.

Психрометрическая жалюзийная будка, также как и будка с самописцами в зимнее время иногда заносилась снегом. Наибольшее число дней с заносами будок наблюдателем отмечены в ноябре—8 дней в декабре—7 дней и в январе—10 дней; отдельные дни с заносами отмечались наблюдателем также и в августе, сентябре, октябре, феврале и марте месяцах.

Температура воздуха. 30 октября в 3-й срок и 29 декабря во 2-й и 3-й сроки из-за урагана измерение температуры производилось около дома при помощи термометра-праща.

Максимальный термометр, установленный на станции, имел проверенную шкалу только до -10° ; при наступлении сильных морозов с января по март, ртуть термометра выходила из пределов шкалы, поэтому пропущенные дни наблюдений по максимальному термометру были восстановлены по термографу. Для получения ежечасных данных температуры воздуха на станции были установлены термографы суточный № 197216/24620 и недельный № 28080, при чем суточный термограф не работал с 24 марта по 19 мая 1931 года, так как часы находились в ремонте; недельный термограф работал непрерывно в течение всего года.

Ежечастные данные температуры воздуха приведены в таблицах по суточному термографу, за время же с марта по май данные приведены по недельному термографу. За 6 дней ноября ежечасные температуры имеют пропуск, так как лента недельного термографа была унесена сильным порывом ветра, а суточный термограф в это время не работал.

Влажность воздуха не обработана за время с 31 октября 1930 г. до 1 февраля 1931 г., так как 31 октября волосок гигрометра оборвался и новый гигрометр был установлен только 1 февраля. Суточный гигрограф № 199390/21363 работал с августа по декабрь 1930 г. и с мая по июль 1931 г.

Ежечасные данные относительной влажности приведены за август, сентябрь и октябрь 1930 г., за июнь и июль 1931 г. В отдельных случаях записи на лентах гигрографа отсутствовали, а именно: в октябре—3 дня, в июне—2 дня, в июле—2 дня.

Флюгер с тяжелой доской был установлен на деревянном столбе высотой в 9 м.

Облачность определялась на станции как общая, так и нижняя, в таблицах ежедневных наблюдений приводятся вместе с количеством облачности и вид облаков за каждый срок. В отдельных случаях форма облаков отмечалась наблюдателем не совсем точно.

Осадки измерялись по дождемеру, установленному на высоте 2 м от поверхности земли недалеко от флю-

диurnal barograph. But beginning with December 25 to July 31 st 1931 they were taken from the weekly barograph, the diurnal barograph having stopped working owing to the bad state of its clock-work.

Out Door Instruments. Two psychrometric screens of the usual type with louvred sides were installed on the plot; the height of the screens over the earth's surface was 2.3 m.

The psychrometric screen with louvred sides as well as the screen containing self recorders got sometimes covered with snow during the winter season. The largest number of days when the screens got buried under snow were noted by the observers in November (8 days) and in December (10 days).

Single days with snow drift were also observed in August, September, October, February and March.

Air Temperature. On October 30 (the third term) and October 29 (the second and third term) a hurricane rendered it necessary to measure the temperature by means of a sling thermometer.

The Maximum thermometer installed at the station had a scale verified up to 10° , with the severe frosts which occurred during the period January—March, the quicksilver passed over the limits of the scale, so the days lost for observations by means of a maximum thermometer were restored with the help of a thermograph. In order to obtain hourly observations of air temperature at the station, a diurnal № 197216/24620 and a weekly № 28080 thermographs were installed; the diurnal thermograph did not work during the period March 24—May 29 1931, its clock work being in repair; the weekly thermograph worked continuously throughout the year.

Data of hourly observations of air temperature are given in the tables, according to the readings of the diurnal thermograph, whereas for the period from March to May the data are given according to the weekly thermograph. There is a 6 day gap in the range of hourly temperatures in November, the ribbon of the thermograph having been blown away by a gust of wind; the diurnal thermograph was not working during this period of time.

The humidity of the air was not worked out. For the period from October 31 to February 1 1932, on October 31 the hair of the hygrometer having been broken, and a new one having been adjusted but on February 1.

The diurnal hygrograph № 199390/21363 worked from August to December 1930 and from May to July 1931.

Hourly data relative humidity are given for August, September and October 1930 and for June and July 1931. In some cases the hydrograph strips showed no traces of curves, notably on three days in October, on two in June and on two in July.

A wind vane with a heavy doarb was installed on a wooden column 9 met. high.

Cloudiness. Both the total and the lower cloudiness were determined at the station and the forms of clouds were given together with their amount in the tables of daily observations for every term. In some cases the determination of the cloud forms was not done by the observer with sufficient accuracy.

Precipitations were measured by means of a raingauge installed in the vicinity of the wind vane, at a height of

VI

гера. В течение зимы столб дождемера заносило снегом, поэтому временами верхний край дождемера возвышался над снежным покровом менее, чем на 1 м.

В зимний период во время сильных ветров и метелей наблюдалось *выдувание осадков*. Часть этих случаев была отмечена наблюдателем.

Метели наблюдателем отмечались по «инструкции для наблюдений над снежным покровом, над метелями и над вскрытием и замерзанием вод», издание 1923 г. Обозначения брались следующие: верхняя обозначалась \oplus , нижняя \ominus , общая \mp .

При подсчете числа дней с метелями были приняты все дни, когда наблюдался хотя бы один из видов метели.

Наблюдения над *снежным покровом* не приведены в таблицах, так как снежной покров на площадке метеостанции не оставался постоянным, а сдувался сильными ветрами, почему в наблюдениях имеются перерывы.

Северное сияние отмечалось в зимнее время регулярно. Явления *изморози и инея* в некоторых случаях отмечены знаком *, т. к. наблюдатель недостаточно четко разбирался в этих явлениях.

Наблюдения на станции велись метеорологом — наблюдателем Голубенковым, А. И., которым во время зимовки были сделаны вычисления основных наблюдений.

Вся дальнейшая обработка выполнена силами Сектора Полярных и Высокогорных наблюдений.

Работа по подготовке материалов к опубликованию лежала, главным образом, на специалисте Сектора Е. К. Шишаковой.

Заведующий Сектором Полярных
и Высокогорных Наблюдений *В. Н. Кедроливанский*.

2 meters over the earth's surface. In winter the column, supporting the raingauge got sometimes buried under snow, so that that upper edge of the raingauge proved less than one meter over the snow surface.

Winter snow drifts and high winds sometimes occasioned a sweeping off of snow out of the raingauge. Some of these cases were noted by the observers.

Snow drifts were noted by the observers according to the «Instructions for Observations on the Snow Cover, Snow Drifts and the Breaking up and Congelation of Rivers» published in 1923, i. e. the symbol of the upper snow drift was \oplus , — that of the ground \ominus , — and of the general \mp .

In computing the number of days with snow drift, all days when even but one of the forms of snow drifts was observed were taken in consideration.

Data of observations on the snow cover have not been inserted into the tables, as the snow cover on the plot bore no permanent character but was every now and then swept away by high winds which occasioned gaps in the observations.

Aurora Borealis was noted regularly in winter.

Owing to the fact that the observer did not distinguish the phenomena of *rime and hoarfrost* clearly enough, the respective data, for some cases, marked by an asterisk *.

The observations were carried on by a meteorologist-observer A. J. Goloubenkoff, by whom preliminary computations of the routine observations were effected during the winter period. All the further work has been accomplished by the staff of the Section for Polar and High Altitude Observations.

The preparation of the whole material for print was intrusted to Miss E. K. Shishakoff, Meteorologist of the Section.

V. N. Kedrоливанский,
Chief of the Section for
Polar and High Altitude Observations
